## Trig Worksheet - Bearings

There are two ways to express a navigational heading or a "bearing".

1. When a single angle is given, it is understood that the bearing is measured in a clockwise direction from due north. The bearing from $A$ to $C$ is $30^{\circ}$.

A
2. The other system starts with a north or south line and uses an acute angle to show direction.

The bearing from $A$ to $C$ is $S 52^{\circ} \mathrm{E}$ ( $52^{\circ}$ East of South)

Give a diagram that represents each bearing.

1. bearing of $32^{0}$
2. bearing of $304^{0}$
3. $\mathrm{N} 42^{0} \mathrm{E}$
4. $S 31^{0} \mathrm{E}$
5. $\mathrm{N} 52^{0} \mathrm{~W}$

Use these methods to draw a diagram to help you solve the following problems.

Problem 1: A ship travels 70 km on a bearing of $27^{\circ}$, and then travels on a bearing of $147^{0}$ for 180 km . Find the distance of the end of the trip from the starting point.

Problem 2: Two lighthouses are located on a north-south line. From lighthouse A the bearing of a ship 3742 m away is $129^{\circ} 43^{\prime}$. From lighthouse $B$ the bearing of the ship is $39^{\circ} 43$. Find the distance between the lighthouses.

Problem 3: Radio direction finders are set up at points A and B, which are 2.00 mi. apart on an east-west line. From $A$ it is found that the bearing of the signal from a radio transmitter is $\mathrm{N} 36^{\circ} 20^{\prime} \mathrm{E}$, while from B the bearing of the same signal is $\mathrm{N} 43^{\circ} 40^{\prime} \mathrm{W}$. Find the distance of the transmitter from $B$.

Problem 4: Radar stations $A$ and $B$ are on an east-west line, 3.7 miles apart. Station A detects a plane at C, on a bearing of $61^{\circ}$. Station B detects the plane at a bearing of $321^{\circ}$. Find the distance from A to C .
